

Mobility: Creating an awareness of life for generations.

Health: Protecting our greatest asset.

Environment: Securing resources for tomorrow.

Project development

From an idea we develop a specific project. Through careful planning and definition we will help you to consider the trends of tomorrow and the desires of mankind.

Design

The perception of beauty and value of a product is determined by its design. However, the desired shape is sometimes contradictory to the function. We will help you to reconcile both aspects.

Development

The development of new products requires great knowledge. We sometimes find the solution even before the problem occurs through intensive work with materials, construction components and systems.

Testing

The secure feeling, whether a new product will withstand the requirements of the daily use is extremely important concerning product liability and confidence in the brand. We will test for you if it turned out right and if it will satisfy your customers in the long term.

IT-Services

Tailor-made and interface-optimised IT-systems help to save time and expenses in collaborative processes. Here we are able to support with proven systems and develop them further according to customer-specific stipulations.

Project processing

The success of a project to a large extent depends on its implementation. Cost aspects, time schedules and the understanding of customer requirements are here vitally important. We take over the complete implementation of your projects.

Supply of personnel

With our trained personnel our know-how comes straight into your company. This will assist you in further reducing interfaces and maximising work processes.

Our benchmark: the human being
We develop, simulate, test, analyse
for visions of the future.

We think ahead.
With pleasure and passion we
find solutions for our customers on a
daily basis. Design, development, engineering
and testing are our areas of expertise.

Our topics are the environment, mobility and health. Our services in design, construction, material and constructional component development through to trial testing and process monitoring take effect throughout the chain of process. Individually developed IT-systems and interfaces support project management and quality control.

In changing times,
where the need for individualisation
and sustainability is growing rapidly, also the
requirements on products of daily life keep
changing. We examine and assess the trends
and integrate them into our work.

We are clever, courageous lateral thinkers, diligent workers, creative colleagues, inventive technicians, ingenious engineers, passionate chemists – in short: a highly qualified, motivated team with an ear for customer requests at any time. We will find the best solutions for you using our expert knowledge, know-how and modern equipment; also through uncommon methods.

For your success.
